#### ABSTRACT

A summary of climatic data during the 1968-71 growing seasons is presented for the subarctic Bonanza Creek Experimental Forest located near Fairbanks, Alaska. Data were obtained from three weather station sites at elevations of 1,650, 1,150, and 550 feet from May until September each year. Data are for relative humidity, rainfall, and maximum, minimum, and mean temperatures. Analyses indicate that Fairbanks mean monthly temperatures were higher than those at Nenana or at the Bonanza Creek Experimental Forest.

Keywords: Climate, temperature, Alaska, humidity, rainfall.

# ALASKA STATE

1/Barney is now stationed at the Northern Forest-Fire Dakoratory, Intermountain Forest and Range Experiment Station, Missoula, Mont. Berglund is now at the School of Forestry, Oregon State University, Corvallis, Oreg.

#### INTRODUCTION

Climatic summaries are often considered to be routine academic collection of data without practical application. This may be a valid criticism in areas of high station density, but it is not true for such areas as subarctic Alaska, where weather stations are few and scattered. By evaluating relatively short-term records, an idea of the locality's climate can be ascertained.

There have been numerous studies of fire, silviculture, ento-mology, wildlife, and plant ecology in interior Alaska. Many of these studies required climatic characterization. This report provides a summary of summertime Bonanza Creek Experimental Forest climatic information.

#### STUDY AREA LOCATION

The Bonanza Creek Experimental Forest is a 13,800-acre (5,585hectare) State-owned area located 14 air miles (22.5 kilometers) westsouthwest of the first order National Weather Service station at the Fairbanks International Airport and 28 miles (45 kilometers) east of the second order station at Nenana (fig. 1). It lies from 64°43'18" to 64°46'19" N. latitude and 148°6'38" to 148°20'22" W. longitude on a generally east-west oriented ridge. This ridge delineates the northern boundary of the Tanana River valley. Over 90 percent of the Experimental Forest is on the south side of the ridge, while the remainder has a northerly aspect (fig. 2).

The Fairbanks and Nenana weather stations are on the Tanana River flood plain at elevations of 436 and 353 feet (133 and 108 meters) above mean sea level. Experimental Forest elevations range from 550 feet (168 meters) at site 3 to 1,650 feet (503 meters) at site 1 (fig. 1).

# DESCRIPTION OF SITES AND INSTRUMENTATION

The three weather station sites were in stands of upland paper birch, Betula papyrifera Marsh. (elevation 1,650 feet), upland black spruce, Picea mariana (Mill.) B.S.P. (elevation 1,150 feet), and lowland black spruce (elevation 550 feet) (table 1, fig. 2). Because of microclimatic differences among cover types, 2/the data reflect the confounding effect of site and elevation.

Stand openings for instrumentation were 100 feet (30.5 meters) in diameter. Standard National Weather Service field shelters or thermoscreens (Cotton Region type) and instrumentation were used at each site. Instrumentation included a hygrothermograph, a maximumminimum thermometer to verify the hygrothermograph thermal sensor, and a tipping-bucket rain gage along with an 8-inch Forest Service

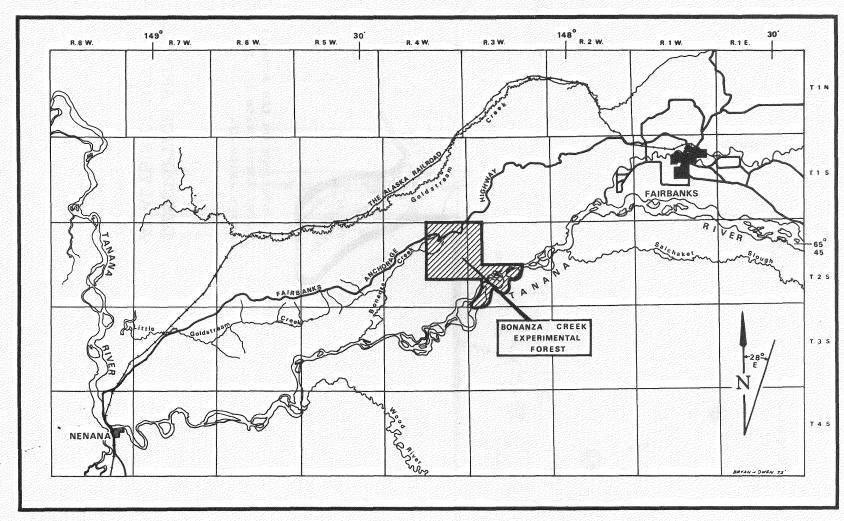

Figure 1.--Bonanza Creek Experimental Forest location in relation to Fairbanks and Nenana, Alaska, where first and second order National Weather Service stations are located.

#### BONANZA CREEK EXPERIMENTAL FOREST

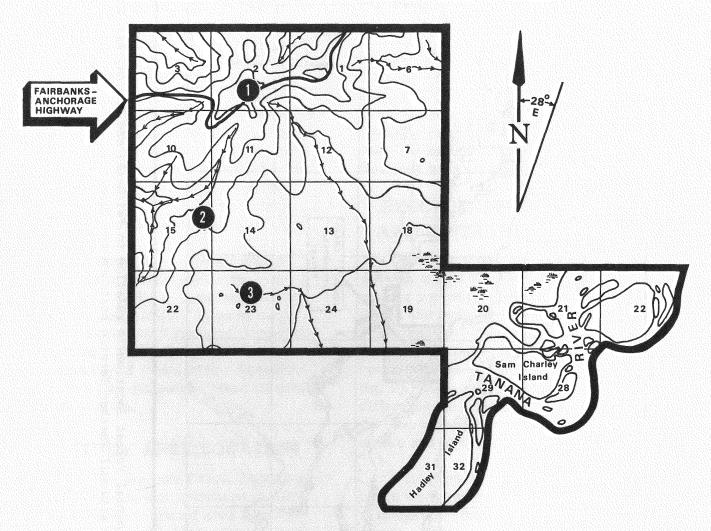

Figure 2.--Weather station site locations and elevations on the Bonanza Creek Experimental Forest, Alaska, upland paper birch (site 1), upland black spruce (site 2), and lowland black spruce (site 3).

nonrecording rain gage. Humidity sensor calibrations were made throughout each season with a fan-aspirated psychrometer. The nonrecording rain gage was used for comparing with the tipping-bucket gage's weekly catch.

# DESCRIPTION AND ANALYSIS OF DATA

The data consist of maximum, minimum, and mean temperatures, relative humidity, and daily precipitation. Daily data were summarized by 5-day and monthly intervals.

Table 1.--Site descriptions on the Bonanza Creek Experimental Forest near Fairbanks, Alaska

	Weather station location										
Characteristic -	Upland pape site		Upland black site		Lowland black						
Elevation (feet, meters)	1,650	502.9	1,150	350.5	550	167.6					
Average dominant height (feet, meters)	55	16.8	33	10.1	9.4	2.9					
Average age (years)	1:	<sub>20</sub> 1/	10	<sub>1</sub> Ψ		<sub>51</sub> 2/					
Average diameter (inches, centimeters)	8	20.3	3.73	9.46	1.05	2.7					
Basal area (square feet per acre, square meters per hectare)	110	25.3	149	34.2	82	18.8					
Density (stems per acre, stems per hectare)	303	749	2,000	4,942	11,067	27,374					

 $<sup>\</sup>frac{1}{2}$  At breast height (4.5 feet above mean ground level).  $\frac{2}{2}$  At ground level.

Data observational periods for each site during the 4-year period from 1968 through 1971 are recorded in table 2. "Daily" observations were those recorded during the defined day of 1400 Alaska Standard Time (0000 G.m.t.) one day to 1400 A.s.t. the following day. Missing data were not a significant problem. Occasional missing observations were estimated from the adjacent stations and the data preceding and following the missing day.

A comparison of the lowland

black spruce (site 3) mean monthly temperature and monthly rainfall was made with corresponding data from Nenana and Fairbanks weather stations (table 3). The analysis of variance for temperature revealed no significant difference between temperatures at the lowland black spruce and the Nenana stations, but the temperature at Fairbanks station was significantly greater at the 1-percent level. This may be attributed to the pocketlike location of Fairbanks and the possible influence on air movement (fig. 1).

Table 2.--Data observational periods for three weather stations, 1968-71, on the Bonanza Creek Experimental Forest, Alaska

Site	Type	Year	Starting date	Ending date
1	Upland	1968	May 28	Sept. 29
	paper birch	1969	May 26	Sept. 14

 $<sup>\</sup>frac{1}{}$  Trace.

Monthly rainfall for the lowland black spruce, Nenana, and Fairbanks weather stations was not significantly different.

From the 4-year monthly means summarized per site in table 4, the only apparent difference between sites was the lower minimum temperatures for the lowland black spruce (site 3). The confounding of site and elevation did not permit separating cover type and elevation influences on observed data.

#### CONCLUSIONS

The data reemphasize the need for at least general climatic information at any study site. There was a significant difference in growing season temperatures between the three weather stations, lowland black spruce, Fairbanks, and Nenana, although data were from similar station locations. It is not sufficient to rely on data from distant but similar weather station sites. Local measurements should be made to insure proper and adequate interpretation.

The mission of the PACIFIC NORTHWEST FOREST AND RANGE EXPERIMENT STATION is to provide the knowledge, technology, and alternatives for present and future protection, management, and use of forest, range, and related environments.

Within this overall mission, the Station conducts and stimulates research to facilitate and to accelerate progress toward the following goals:

- 1. Providing safe and efficient technology for inventory, protection, and use of resources.
- 2. Development and evaluation of alternative methods and levels of resource management.
- Achievement of optimum sustained resource productivity consistent with maintaining a high quality forest environment.

The area of research encompasses Oregon, Washington, Alaska, and, in some cases, California, Hawaii, the Western States, and the Nation. Results of the research will be made available promptly. Project headquarters are at:

Fairbanks, Alaska Juneau, Alaska Bend, Oregon Corvallis, Oregon La Grande, Oregon Portland, Oregon Olympia, Washington Seattle, Washington Wenatchee, Washington
